Application Note – DCS Irrigation Controller

APN008 25 August, 2011

Purpose

DCS's Irrigation Manager is a SkyRouter resident application program that controls the application of water through commercial and residential irrigation systems. The application maintains two daily schedules for up to 45 separate irrigation zones.

The purpose of this Application Note (APN008) is to provide the information necessary to configure and operate the application and interpret the reports and alarms issued.

Scope

Figure 1 shows a DCS Irrigation Controller in the context of an existing irrigation installation.

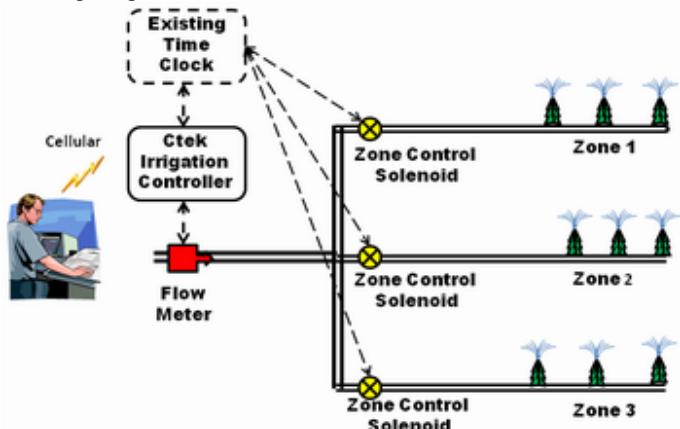

Figure 1 - Controller in an existing system

While all of the components of a complete irrigation system will be discussed for completeness the scope of APN008 is the theory and operation of the Irrigation Control software application.

Navigation and Top Level Functions

When installed the Irrigation Controller Application is found under the applications selection on the top level SkyRouter administration screen. It may also be offered as a top level function immediately after login if the application advertising option is selected.

The SkyRouter presents the following navigation menu when application advertising is used.

Series 4200 SkyRouter

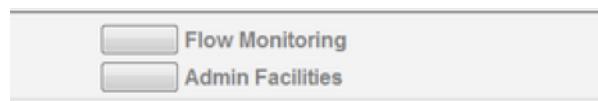

Figure 2 - Top Level Screen

This document will first cover the Flow Monitoring settings and then will address the portions of the Admin Facilities menu important to this application. Complete coverage of the Admin Facilities menu can

Application Note – DCS Irrigation Controller

APN008 25 August, 2011

be found in the SkyRouter User manual for the specific SkyRouter model you are using.

Flow Monitoring Configuration

Selecting the Flow Monitoring menu option presents the following screen which provides access to all of the Irrigation Controller features and functions.

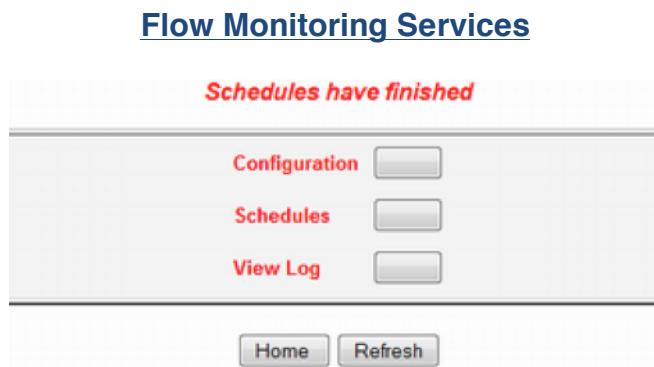

Figure 3 - Flow Monitoring Menu

Configuration

The flow monitoring configuration screen is used to establish all of the operating parameters of the Irrigation application. The screen is

divided into 8 panels, each of which configures a specific portion of the complete application. Individual parameters for each panel are discussed below and an image of the screen is provided in Figure 4 for reference.

Location Parameters - These settings establish a name for the irrigation site and create the assumptions that will be tuned as an operational baseline for the site is established

Location Name - A descriptive name that can be assigned to each irrigation controller/site. Will be used on reports and alarms.

Number of Zones - The number of sprinkler zones that will be managed from this controller. The number of zone slots allocated in the schedule page is a direct result of this setting.

Gallons Per Minute - This important setting is used in the calculation of the over/under thresholds. An initial estimate can be fine tuned over time using actual water usage information gathered by the controller.

Percentage Over/Under - Established the threshold for over/under reports and alarms. Make use of the Gallons Per Minute setting above. Example - a 10 minute schedule at 10 gallons per minute and a 20% over/under will alarm at below 80 gallons and above 120 gallons.

Figure 4 - Configuration Screen

Application Note – DCS Irrigation Controller

APN008 25 August, 2011

Irrigation Clock Override

Enable/Disable Clock - Provides a mechanism to completely isolate the electro-mechanical sprinkler clock from control over the irrigation zones. The Disable setting means that the DCS Irrigation controller will prevent the mechanical clock from ever turning water on to a zone.

Note - In the event of a hardware or power failure at the DCS Irrigation controller control always reverts to the schedule of the installed electro-mechanical clock without regard to the enable/disable setting above.

Schedule Selection

Schedule 1 & 2 On/Off - enable or disable the use of schedule 1 and/or schedule 2

Alarm Selection and Configuration

Scheduled Usage Alarms On/Off - Enable or disable alarms resulting from over or under thresholds during the scheduled irrigation cycle for a particular zone.

Unscheduled Usage Alarms On/Off - Enable or disable alarms resulting from water usage above a prescribed threshold outside the time periods allocated to schedules.

Alarm delivery Method - Select the method(s) by which alarms will be sent to the user.

Unscheduled Alarm Volume - The threshold of water usage outside the time periods allocated to schedules above which an unscheduled alarm will be issued.

SMS Alarm Parameters

Note - SMS (Short Message Service) is commonly referred to as a text message.

Destination Phone Number - The 10-digit phone numbers of the handset or SMS terminal to receive SMS alarms. Up to five phone numbers may be specified, each separated by a space.

Email Alarm Parameters

Destination Email Address - The complete email address of the destination for email alarms. Multiple email addresses may be specified, each separated by a comma or space.

Report Delivery Parameters

Deliver Reports Via Email On/Off - Enable/disable the email delivery of daily usage reports. Reports are also available online for viewing.

Deliver To Email Address - The complete email address of the destination for email reports. Multiple email addresses may be specified, each separated by a comma or space.

Application Note – DCS Irrigation Controller

APN008 25 August, 2011

Deliver Reports On The Following Days After Schedules Run - Used to select the days upon which reports will be sent to a destination address.

Email Server Configuration

In order to send email alarms and reports each DCS Irrigation controller must be assigned an email address, an address from which the email alarms and reports will originate. The same email address can be assigned to all controllers but each controller must have an email address if email is to be used.

DCS provides a POP3 email client to support email communications. While the settings may vary somewhat from one email service to another this section describes the most commonly used settings and also provides a set up example using Google's gmail service.

All of these settings are available from your email provider or ISP.

Email Address For This Device - A complete email address that will be assigned to the POP3 client on this device. Again, this address and other account settings can be identical for any number of devices using the same email system.

Email User Name - The name used by the email client to log in to an email server and send email. Some services require that this name be the email address of the user, others will allow almost any name.

SMTP Server Address - An address specified by your email provider or ISP that will be used by the email client to reach the Simple Mail Transfer Protocol (SMTP) server. The SMTP server is responsible for sending outgoing emails.

Authentication On/Off - This setting is based on whether or not your email SMTP server requires authentication to log in to the SMTP server. Most do. DCS's POP client uses SSL authentication.

Email Password - The password that was established when your email account was created.

SMTP Server Port - The port number that the SMTP server listens on. For SSL authentication this is usually Port 465. Consult your email providers set up instructions.

SSL Authentication On/Off - Again, consult your email provider, they will establish this requirement.

Gmail Set Up Example

User Name - your_gmail_account@gmail.com

Email address - your_gmail_account @gmail.com

Password - Your_Choice

SMTP Server Address - smtp.gmail.com

Authentication required - Yes

SSL Encryption - Yes

SMTP Server Port - 465 (normal for SSL)

Flow Monitor Schedule

Figure 5 illustrates the two schedule capability of the DCS Irrigation controller. Schedule 1 applies water to all seven zones seven days a weeks while schedule 2 applies additional water to zones three and four on Saturday and Sunday.

Application Note – DCS Irrigation Controller

Update

Back

Figure 5 - Flow Monitor Schedule

Application Note – DCS Irrigation Controller

APN008 25 August, 2011

Start Time - A 24 hour clock setting used to determine when the schedule will begin. Each active zone schedule will be executed upon the completion of the last.

Sun, Mond, ... Sat - Check boxes to select which days of the week the schedule will be applied.

Enable - Select the zones that will be irrigated under this schedule

Minutes - The length of time that a zone will be irrigated. You will want to tune this value once an operational baseline has been established. The percentage of Over/Under from the configuration screen is applied to the value of Gallons/Minute * Minutes to arrive at over and under thresholds.

Reports, Alarms, and Logs

Reports and alarms are delivered to the user via email, and in the case of alarms by SMS (text messaging) as an option. Logs are available online through the top level menu selection shown in Figure 3.

Reports

Reports are delivered to the user via email in a comma separated (CSV) format. This format allows to report to be viewed and manipulated by most spreadsheet software packages and also

makes it convenient to import the report content into many database applications. When viewed in a conventional text editor the report displays the CSV format as shown in Figure 6.

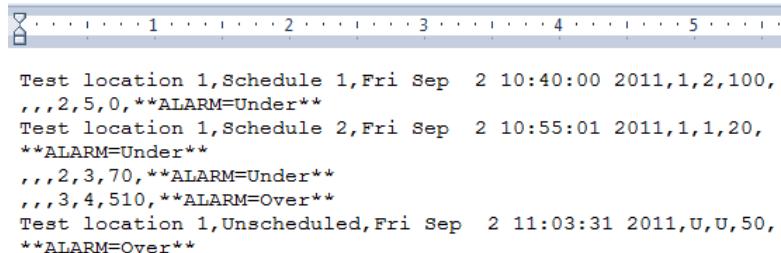

A screenshot of a Windows-style text editor showing a CSV file. The file contains several lines of data, each representing a log entry. The columns are separated by commas. The data includes location, schedule, date and time, and various numerical values and status codes. The status codes include 'Under', 'Over', and 'Unscheduled'. The text editor has a standard toolbar at the top and a status bar at the bottom.

Figure 6 - Report CSV Data

When viewed in a spreadsheet program the same report displays as shown in Figure 7. Using a spreadsheet program the data can be manipulated to produce custom reports and invoices.

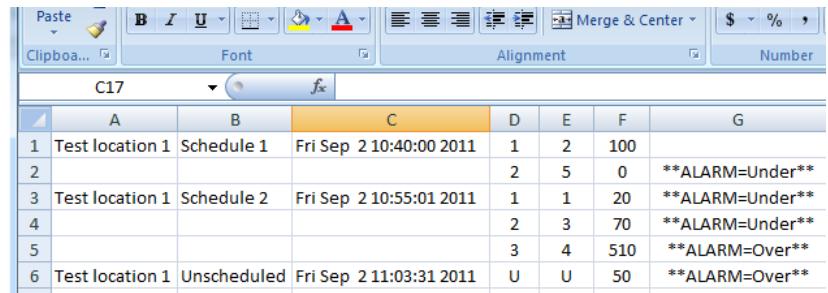

A screenshot of a Microsoft Excel spreadsheet. The data is organized into columns labeled A through G. Column A contains the location, column B contains the schedule, column C contains the date and time, and columns D, E, and F contain numerical values. Column G contains status codes such as 'Under', 'Over', and 'Unscheduled'. The status codes in column G are preceded by double asterisks (**) and followed by text like 'ALARM=Under'. The spreadsheet has a standard toolbar at the top and a status bar at the bottom.

Figure 7 - Report In Spreadsheet

Application Note – DCS Irrigation Controller

APN008 25 August, 2011

Field definitions for the report are provided below and are referenced to the spreadsheet column designator.

Column A - The name assigned to this particular unit on the configuration screen.

Column B - The schedule (schedule 1 or schedule 2) being reported

Column C - The date and time of the schedule completion or event.

Column D - The Zone being reported on. U indicates unscheduled usage.

Column E - Reports the number of minutes that the schedule ran

Column F - The number of gallons applied during the scheduled interval

Alarm Events - Alarm Under indicates that less water was applied than would be expected to result from gallons per minute (GPM) multiplied by Scheduled Minutes within the plus or minus tolerances assigned as a percentage on the Configuration screen. In the case of Unscheduled Usage the Over/Under calculation is based solely on the Unscheduled Volume value on the Configuration Screen.

Alarms

Alarms are transmitted to the specified destination addresses when events at the controller are outside of the parameters established on

the Configuration screen (Fig 4) and the Schedule (Fig 5). Alarms can be transmitted via email and/or by SMS to a cellular device.

The Alarm formats are as follows are shown in the following sections. Both email and text messaging formats may differ to some extent based on formatting performed by the receiving client application.

Email or Text Alarm - Over

Fri Sep 2 11:03:01 2011
Location Test location 1
Schedule 2 Zone 3 Run Time 4
Over maximum volume of 220
Current volume is 510

Email or Text Alarm - Under

Fri Sep 2 10:59:01 2011
Location Test location 1
Schedule 2 Zone 2 Run Time 3
Under minimum volume of 135
Current volume is 70

Email or Text Alarm - Unscheduled Usage

Fri Sep 2 10:39:09 2011
Location Test location 1
Unscheduled Usage over maximum volume of 10 Current volume is 50
